- `frackable()`

frackable

Create vulgar fractions using unicode

Parameters

```
frackable(  
  numerator: integer string ,  
  denominator: integer string ,  
  use-predefined: boolean  
) -> content
```

numerator integer or string

The top part of the fraction.

Default: 1

denominator integer or string

The bottom part of the fraction.

Default: 2

use-predefined boolean

While this function can typeset arbitrary vulgar fractions, there are some for which there is a predefined unicode codepoint that is prioritized. Set this value to false to prevent predefined codepoints being used.

```
#frackable() \  
#frackable(use-predefined: false)
```

½
½

Default: true
